Subject: PSA Test Results and Recommendation for Prostate Biopsy

Dear [Patient Name],

I am writing to share the results of your recent Prostate Specific Antigen (PSA) blood test. Your PSA level was measured at [PSA Value] ng/mL. This represents an increase from your previous baseline of [Previous Value] ng/mL.

While an elevated PSA level can be caused by non-cancerous conditions such as inflammation or an enlarged prostate, it can also be an early indicator of prostate cancer. To determine the exact cause of this elevation, I recommend that you undergo a prostate biopsy.

A biopsy is a brief procedure where small tissue samples are taken from the prostate for examination under a microscope. This is the most definitive way to confirm or rule out the presence of cancer cells.

Please contact our office at [Phone Number] to schedule this procedure or to arrange a follow-up appointment to discuss the details, risks, and benefits of the biopsy. We are here to answer any questions you may have.

Sincerely,

[Doctor's Signature]
